"An integrated analysis of the genome of the hyperthermophilic RT archaeon Pyrococcus abyssi.";

Whol. Microbiol. 47:1495-1512(2003).

CC -!- CATIVITY: (S) malate + NAD(+) = oxaloacetate + NADH.

CC -!- SUBUNIT: Homodimer (By similarity).

CC -!- SUBCILIULAR LOCATION: Cytoplasmic (Probable).

CC -!- SIMILARITY: Belongs to the LDH2/MDH2 oxidoreductase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁

WPI; 2003-450961/43. N-PSDB; ADB63452.

New polynucleotides and polypeptides, useful for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy.

Claim 1; Page; 222pp; English.

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polynucleotide or its partial peptide, an antibody binding to the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide peptide of the polynucleotide by contacting the polypeptide or peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               with the antibody of the encoded protein, and observing the binding to between the two, a transformant carrying the polynucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide, or as a probe consistency of the polynucleotide. The polynucleotide is useful as a primer for synthesising the polynucleotide, or as a probe consistency of the polynucleotide and encoded consistency of the polynucleotide and encoded consistency of the polynucleotide and encoded consistency of the included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of genes therapy. The genes are involved in tissue and/or cell conscription-related proteins, signal transduction-related proteins, conscription-related proteins, disease-related proteins and genes encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                 The present invention describes a method for diagnosing a disorder characterised by expression of a human cancer associated antigen (CAA) precursor (I) coded by a NA Group 1 nucleic acid molecule (N1) comprising contacting the biological sample with an agent (A) that specifically binds to N1, (I) or its fragment, complexed with an human leukocyte
                                                                                                                                                                                                                                       Example
                                                                                                                                                                                                                                                                                                             with a

determining

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties.

(I) has cytostatic activity and can be used in gene therapy and vaccine production. The method can be used for treating a subject with a condition characterised by expression of (I) in cells c subject. ARB75607 and ARB75608 represent proteins from human cancer associated antigen precursors, and ARB75609 to ARB75802 represent HLA class I binding motifs in human cancer associated antigen precursors given in the exemplification of the present invention
                                                                                                                                                                                                                             Cao Y,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic formar from the printed specification but was obtained in electronic
 The invention relates to a recombinant DNA promoter functional in a plant cell, where provide for expression of a polynucleotide
                                                                                                New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                            Cao Y,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           having an improved property comprises transforming a plant with the polymucleotide or polympetide is useful for improving plant, where the polymucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plant properties. In the comprise of the combinant DNA construct is useful for producing plants with collerance to plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan condition. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant
                                                                                                                              Skerra

                                                Six derivatives of pASK46 (a plasmid for expression of the D1.3Fv fragment in E.coll) were produced which encode 4 different peptides at the C-terminus of VH and 2 peptides at the C-terminus of VL of the D1.3Fv fragment. The peptides fused to the C-terminus are all examples of streptavidin-binding peptides corresponding to a generic formula (see AAR52698). The peptides do not interfere with the protein function but facilitate purification by conferring streptavidin-binding properties on the fusion protein
                                                                                                                                                                                                                                                                                                   Disclosure; Page 11; 53pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         pASK46-pllXH encoded C-terminal streptavidin-binding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAR52693;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Six derivatives of pASK46 (a plasmid for expression of the D1.3Fv fragment in E.coli) were produced which encode 4 different peptides at the C-terminus of VH and 2 peptides at the C-terminus of VL of the D1.3Fv fragment. The peptides fused to the C-terminus are all examples of streptavidin-binding peptides corresponding to a generic formula (see AAR52698). The peptides do not interfere with the protein function but facilitate purification by conferring streptavidin-binding properties on the fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  10-JAN-1995

CC transformed plant having an improved property. The plant is a crop plant CC transformed plant having an improved property comprises transformed plant with the CC having an improved property comprises transformed plant with the CC recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant with the CC improved plant properties e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of CC content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of protein yield and/or CC phosphorus use and/or uptake, by modification of protosynthesis or by condition, improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan CC production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.

                                                                                                    recombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid. The nucleic acids are chosen from 3654 disclosed sequences encoding 3654 disclosed proteins. The nucleic acids is useful for diagnosing pathological conditions resulting from E. faecium bacterial infection (e.g. urinary tract infection, bacteraemia, endocarditis, wounds and abdominal-pelvic infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida albicans derived peptides or antisense polypeptides. Pharmaceutical compositions and vaccines containing the nucleic acid are useful for preventing or treating Enterococcus faecium infections. The present sequence represents one if the disclosed E. faecium proteins.
                                                                        Sequence 482 AA;
                                                                                                                                                                                                                                                                                                                                         Enterococcus faecium encoding an Enterococcus faecium polypeptide having one of 10 fully defined sequences given in the (or comprising 40 sequential nucleotides chosen from any of the nucleic acids, its complement or sequences hybridising to it). Also included and a complement or sequences hybridising to it). Also included and the complement of sequences hybridising to it).

                                                                                  cc the 5213 antisence sequences given in the specification where expression cc of the nucleic acid inhibits proliferation of a cell. Also included are: cf (1) a vector comprising a promoter operably linked to the nucleic acid (2) a vector comprising a promoter operably linked to the nucleic acid (2) a host cell containing the vector; (3) an isolated cc nucleic acid; (4) an antibody capable of specifically binding cp polypeptide; (5) producing the polypeptide; (6) producing the polypeptide; (6) producing the polypeptide; (6) producing the polypeptide; (6) inhibiting cellular cc proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway compound that influences the activity of identifying a gene required for cellular proliferation or the biological pathway of required for proliferation, or that inhibits cellular proliferation; (8) cc required for proliferation, or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a cc organism acts; (9) manufacturing an antibiotic; (10) profiling a cc organism acts; (9) manufacturing an antibiotic; (10) profiling a cc pathway in which a proliferation of the trains; or (13) identifying the target of a compound that inhibits proliferation of compound that inhibits proliferation of the strains is present in a culture or collection of compound that inhibits the compound that inhibits the strains; or (13) identifying the target of a compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits the compound that inhibits are useful for compound that inhibits are useful for compound that inhibits are useful 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABU19450;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Neisseria gonorrhoeae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins a antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       12-FEB-2002; 2002WO-IB002069.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         10-OCT-2002

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL016140-ABL16175) and the encoded protteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIFO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  conjugates a serine to a glycine to produce a peptide. The peptide is then conjugated (through the glycine) to a phenylalanine. Each amino acid is incorporated into the peptide chain by a unique module. After addition of the phenylalanine, the peptide chain is then transferred to the mppB component. MppA is about 295 kba. The invention provides a method of producing NRPS using transformed host cells. It also provides a method of producing a cyclic peptide antibiotic, such as AC98, using the NRPS comprised of mppA and mppB. The antibiotic is preferably a lipoglycopeptide antibiotic with activity against Gram-positive pathogens. Also provided are methods of modifying NRPS, e.g. by replacement of an adenylation domain, to produce an antibiotic having a modified peptide core, and a method for evaluating the structural regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 2747 AA;

                                                The present invention describes a method of detecting nascent proteins involving aminoacylating a tRNA molecule with a 4,4-difluoro-4-bora-3A,4A involving aminoacylating a tRNA molecule with a 4,6-difluoro-4-bora-3A,4A diaza-s-indacene (BODIPY) marker leading to the production of a misaminoacylated tRNA. This enables the detection, isolation and analysis of nascent proteins using UV without the usual accompanying radioactivity problems. It may be used to detect mutations, for example in cancer, Duchenne muscular dystrophy, adenomatous polyposis coli and colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW59211 and AAW59212 are ligands used in a method to assay binding affinity of streptavidin mutants. These mutants have a mutation within the amino acid (aa) region 44-53 of the wild-type protein show a higher binding affinity than the wild-type for peptide ligands that include the sequence of formula Trp-X-His-Pro-Gln-Phe-Y-Z where X = any aa; Y and Z are both Gly, or Y = Glu and Z = Arg or Lys. Recombinant streptavidin mutants can be used to isolate, purify and determine proteins or to determine/recover substances that contain streptavidin-binding groups. Such compounds may also be used to immobilise fusions on microtitre
                                                                                                                                                                                                                                                                                                                                     Method for detecting nascent proteins by fluorescence comprises misaminoacylating a tRNA molecule with a marker compound, useful for detecting mutations in proteins, e.g. cancer.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                              Score

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score

Patent No. 6703491

GENERAL INFORMATION:
APPLICANT: Homburger et al.
APPLICANT: Homburger et al.
APPLICANT: Homburger et al.
TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster
FILE REFERENCE: File Reference: 7326-094
CURRENT APPLICATION NUMBER: US/09/270,767
CURRENT APPLICATION NUMBER: US/09/270,767
CURRENT FILING DATE: 1999-03-17
NUMBER OF SEQ ID NOS: 62517
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 47543
LENGTH: 128
TYPE: PRT
      Sequence 2, Application US/08948097C
Patent No. 6103493
GENERAL INFORMATION:
APPLICANT: Skerra, Arne
APPLICANT: Voss, Selma
TITLE OF INVENTION: Streptavidin Muteins
                                                                                                                                                                                                                                                  Query Match

Sequence 31, Application US/09809517A
Patent No. 6753136
GENERAL INFORMATION:
APPLICANT: Lokining, Corinna
ITILE OF INVENTION: No. 6753136el methods for displaying (poly)peptides/proteins on b
ITILE OF INVENTION: No. 6753136el methods for displaying (poly)peptides/proteins on b
ITILE OF INVENTION: No. 6753136el methods for displaying (poly)peptides/proteins on b
ITILE OF INVENTION: No. 6753136el methods for displaying (poly)peptides/proteins on b
ITILE OF INVENTION: NO. 6753136el methods for displaying (poly)peptides/proteins on b
ITILE OF INVENTION: NUMBER: US/09/809,517A
CURRENT APPLICATION NUMBER: US/09/809,517A
CURRENT FILING DATE: 2001-03-15
PRIOR APPLICATION NUMBER: EP 99114072.4
PRIOR APPLICATION NUMBER: EP 00103551.8
PRIOR PILING DATE: 2000-02-18
NUMBER OF SEQ ID NOS: 41
SOFTWARE: Patentin version 3.0
SEQ ID NO 31
LENGTH: 24
TYPE: PRT
ORGANISM: artificial sequence
FEATURE:
FEATURE:
FEATURE:
FORMATION: Description of Artificial Sequence: synthetic module
